# Academic Success and Students Satisfaction 

The Vice-Chancellor’s Office for Quality<br>Universidad de Oviedo

## Overview

This is a study of an student and lecturer survey on teaching. It is a pilot project, carried out during the 1999-2000 academic year at the University of Oviedo, correlating the results of the survey and ratios of academic success in an attempt to gauge the extent to which the degree of student satisfaction with the teaching they have received is dependent on having been academically successful in the subject rated in the survey. Results point to there being several advantages of the survey methodology over conventional methods, as well as showing that, generally speaking, students are more satisfied with teaching in subjects with a higher pass rate, though satisfaction levels fall for optional subjects when pass rates are higher. This correlation between performance and expectations is a good predictor of satisfaction with the teaching that was imparted.

Key words: Academic success, Performance, Satisfaction, Analysis of Variance, Reliability, Factor Analysis.

## 1. HOW THE STUDY WAS ORGANISED.

The efficiency of university teaching and the levels of student satisfaction have been a common focus of academic work of great import to the university system and its quality control (Tejedor, $\mathrm{J}^{1}$, 2002).

As part of its process of progressively reintroducing teacher evaluation, the University of Oviedo has extended its satisfaction survey to include students and lecturers in all courses. The procedure involved filling in a questionnaire after the summer break so that students and teaching staff could evaluate the teaching imparted in the previous course.

Furthermore, performance in each subject is analysed yearly and presented in a report that includes several yardsticks for each course, including latest enrolment figures, number of classes taught per subject, pass rates and performance per subject, drop-out and graduation rates, alongside the average time required to complete each of the courses offered by the University of Oviedo and the average for Spanish universities as a whole.

[^0]The aim of the study is to analyse the link between academic results and student satisfaction with the teaching they received by comparing the marks given by the students to each lecturer in the satisfaction survey with examination pass rates and performance in the same lecturer's subject.

47,744 valid satisfaction questionnaires were returned by students, with 6,354 students out of a possible 28,312 taking part. The response rate is therefore $22.4 \%$.

As the survey was voluntary, students wishing to express complaints might be more expected to reply. However, a number of control variables, such as lecture attendance rates, were applied in order to measure the goodness and validity of the consultation. Assuming that individuals were telling the truth, no anomalous circumstances were detected in the profile of students who responded to the survey (Harvey, L., 2003). ${ }^{2}$

One objective way to measure the success of subjects is by the number of passes. This study did indeed apply exam pass and performance rates, defined as the percentage of passes compared to students sitting the exam and the percentage of passes compared to the number of students enrolled in the subject respectively, i.e.

$$
\begin{gathered}
\text { Performance Rate }=\frac{\text { Exam Passes }}{\text { Registered Students }} \times 100 \\
\text { Pass Rate }=\frac{\text { Exam Passes }}{\text { Students Sitting the Exam }} \times 100
\end{gathered}
$$

A study of the two rates will provide an analysis not only of the direct link between satisfaction and success but also of student expectation as it changes over a particular course. This will be expressed as the difference between the number of students enrolled and the number of students sitting examinations. Our hypothesis is that this adjustment of expectations largely determines satisfaction with teaching staff and the teaching imparted.

## 2. EXAM PASS RATES, PERFORMANCE AND SATISFACTION

The average pass rate for the subjects covered by the study for the 2001/2002 academic year was $70.3 \%$, and the equivalent performance rate was $59.7 \%$. Logically, correlation between the two variables is very high, with a Pearson correlation coefficient of 0.80

Table 1.- Descriptive Statistics

|  | Mean | s.d. | Min | $\mathbf{P ( 2 5 )}$ | $\mathbf{P ( 5 0 )}$ | $\mathbf{P ( 7 5 )}$ | Max | n |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Enrolments | 148,88 | 152,59 | 8 | 59 | 101 | 172 | 1218 | 1462 |
| Pass Rate | 70,26 | 18,64 | 36,40 | 56,60 | 68,50 | 85,10 | 99,00 | 1462 |
| Performance | 59,73 | 20,96 | 5,00 | 43,98 | 60,14 | 76,66 | 100,00 | 1462 |
| s.d.; Standard Deviation, Min; minimum, P(25), P(50), P(75); percentiles $25,50,75$, Max; maximum, n; number of subjects |  |  |  |  |  |  |  |  |

Grouping subjects according to general satisfaction with teaching shows that over $77 \%$ of our students score satisfaction at over five, and $12.3 \%$ mark at over 8 .

| $\mathbf{> 8}$ | 180 | 12,3 | 100,0 |
| Total | 1462 | 100,0 |  |

Fig. 1- The spread of satisfaction scores.

## 3. THE MAIN COMPONENTS OF SATISFACTION

Student evaluation of satisfaction is highly correlated throughout the items of the questionnaire, and the principal components (Table 3) indicates how the first factor, linked to item 15 on 'overall satisfaction with the lecturer's work', explains just over $65 \%$ of total variance. When a second factor, linked almost completely to item 14 on 'satisfaction with the physical setting in which teaching is imparted', is considered, the percentage of total variance that is explained rises to $72 \%$. These two questions of general satisfaction with teaching staff and physical teaching conditions are therefore the two sources of variance in the questionnaire.

The component analysis (Table 3) shows that all the original items are well identified by the two factors that were highlighted, and the components (Table 4) similarly indicates that the first factor explains all the initial variables except Resources, which is explained by the second component.

Table 3.- Explained overall variance

| Personal Relations | , 878 |  |
| Tutoring <br> Resources | , 871 | , 896 |
| Overall satisfaction | , 924 | , 89 |

As factor analysis demonstrates that the two highlited factors correspond to a great degree with the variables of Satisfaction and Resources, these will be used henceforth so as to maintain the original references.

A further interesting reference on the student satisfaction questionnaire relates to reliability, which scores 0.948 on Cronbach’s alpha test (the appendix provides further details on this test).

## 4. THE RELATIONSHIP BETWEEN ACADEMIC SUCCESS AND STUDENT SATISFACTION

The analysis covered 1,462 subjects and excluded subjects with less that 8 student enrolled on the course and those that were evaluated by fewer than five students.

An analysis of the link between success and satisfaction (figure 2) points to there being high values for both variables; no 'anomalous’ patterns are found in the position of the subjects in any of the quadrants.

Figure 2.- Scatter diagram of overall satisfaction (V15) and success per subject.

When all the subjects are considered as a whole, satisfaction is clearly seen to increase in line with success. However, the correlations obtained are low, with a Pearson correlation coefficient of 0.352 , ranging between 0.257 for studies in the Humanities and 0.413 for Experimental Sciences

### 4.1. OVERALL SATISFACTION AND ‘SUCCESS GROUPS’.

Given the wide variety in the success rate across different types of subjects, we divided the population into five groups (G1-G5) with roughly the same number of subjects in each of them. Table 5 describes the Satisfaction, Success and Performance variables for each of the groups that were formed.

Table 5.- Descriptive data by Groups

|  | Satisfaction with conditions.(V14) |  |  |  |  | Satisfaction with teaching.(V15) |  |  |  |  | Success |  |  |  |  | Performance |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Mean. | s.d. | Min | Máx | N | Mean | s.d | Min | Máx | N | Mean. | s.d. | Min | Máx | N | Mean. | s.d. | Mn | Máx | N |
| G1 | 5,73 | ,96 | 3,13 | 8,67 | 292 | 5,38 | 1,46 | 1,00 | 9,17 | 292 | 42,61 | 7,81 | 14,70 | 52,94 | 292 | 35,12 | 12,23 | 5,0 | 72,73 | 292 |
| G2 | 5,78 | 1,11 | 1,43 | 8,17 | 293 | 5,84 | 1,39 | 1,22 | 9,00 | 293 | 59,63 | 3,50 | 53,09 | 65,81 | 293 | 49,49 | 13,29 | 16,00 | 91,49 | 293 |
| G3 | 5,77 | 1,11 | 1,50 | 9,00 | 293 | 6,10 | 1,57 | 1,33 | 9,23 | 293 | 71,33 | 3,33 | 65,85 | 77,00 | 293 | 60,39 | 13,81 | 11,11 | 93,48 | 293 |
| G4 | 5,79 | 1,26 | 1,14 | 8,83 | 292 | 6,78 | 1,42 | 1,07 | 9,50 | 292 | 82,34 | 3,25 | 77,08 | 88,79 | 292 | 72,25 | 12,75 | 22,22 | 100 | 292 |
| G5 | 5,78 | 1,41 | 1,00 | 9,00 | 292 | 6,85 | 1,60 | 1,78 | 9,83 | 292 | 95,51 | 3,91 | 88,89 | 100 | 292 | 81,41 | 13,54 | 23,81 | 1000 | 292 |

The standard tests used for contrasting normality confirm the hypotheses required for parametric tests. Subsequent ANOVA results (Table 6) indicate significant differences between "subject success groups" as far as general satisfaction is concerned, but not as far as assessment of resources and the physical teaching environment is concerned.

Table 6.- ANOVA by success groups

\left.|  |  | Square Sum. | df | Square Mean. | F | Sig. |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: |
| Resources | Inter-groups | Intra-groups | 2027,771 | 1457 | , 190 | , 136 |$\right], 969$

Post hoc Student-Newman-Keuls tests show that differences in the average satisfaction values (Table 7) increase to a significant extent in all groups except the last two, where no significant differences are observed.

Table 7.- Means values for satisfaction

| 'SUCCESS GROUPS |  | N | Subsets for alfa $=.05$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | Sig. |  | 1,00 | 1,00 | 1,00 | ,57 |

### 4.2 SUCCESS AND PERFORMANCE BY 'SATISFACTION GROUPS’

Having established the basic relationship between satisfaction and academic success, interests shifted towards a more in-depth analysis of the influence exerted on satisfaction by the components associated to the success rate relative to the number of students who responded to the survey (n), and to variation in student expectation between enrolled students and students sitting the examinations, which is expressed as the difference between Success and Performance rates.

UNIVERSIDAD DE OVIEDO
Vicerrectorado de Calidad e Innovación

Table 8.- ANOVA per satisfaction groups

|  |  | Square Sum. | df | Square Mean. | F | Sig. |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{n}$ | Inter-groups | 34545,421 | 3 | 11515,140 | 15,973 | , 000 |
|  | Intra-grupos | 1051064,503 | 1458 | 720,895 |  |  |
|  | Total | 1085609,924 | 1461 |  |  |  |
| Success | Inter-groups | 51734,783 | 3 | 17244,928 | 53,971 | , 000 |
|  | Intra-groups | 465866,251 | 1458 | 319,524 |  |  |
|  | Total | 517601,033 | 1461 |  |  |  |
|  | Inter-groups | 64754,341 | 3 | 21584,780 | 54,506 | , 000 |
| Performance | Intra-groups | 577378,891 | 1458 | 396,007 |  |  |
|  | Total | 642133,233 | 1461 |  |  |  |
|  | Inter-groups | 1379,044 | 3 | 459,681 | 2,931 | , 033 |
|  | Intra-groups | 228692,682 | 1458 | 156,854 |  |  |

A comparison of success and performance rates according to satisfaction groups (Table 8) shows that the differences are highly significant, as also are the differences between the number of students responding to the survey ( n ), and the new variable Success-Performance, or expectation adjustment.

Table 9.- Pass Rate

| $\mathbf{2 - 5}$ | 307 |  | 29,88 |
| $\mathbf{5 - 8}$ | 956 |  | 30,56 |
| Sig. |  | 1,000 | , 699 |

Table 12.- Success-Performance

|  | $\mathbf{N}$ | Subset for alfa $=\mathbf{. 0 5}$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Satisfaction (V15) |  |  |  |  | $\mathbf{1}$ | $\mathbf{2}$ |
| $<\mathbf{2}$ | 19 | 17,6207 |  |  |  |  |
| $\mathbf{2 - 5}$ | 307 |  | 11,3969 |  |  |  |
| $\mathbf{5 - 8}$ | 956 |  | 10,3122 |  |  |  |
| $>\mathbf{8}$ | 180 |  | 9,6225 |  |  |  |
| Sig. |  | 1,000 | , 702 |  |  |  |

Post hoc Student-Newman-Keuls tests point to the conclusion that higher satisfaction levels correspond to those subjects where there are enrolled fewer undergraduates (an average of 16; cf. Table 11), and those where there are higher success and performance ratios (c.f. Tables 9 and 10).

As for the issue of expectation adjustment, confirmation is made of the initial hypothesis regarding a link between satisfaction and the adjustment of performance rates and pass rates or of registration figures and numbers of students sitting examinations (Table 12).

## 5. SUCCESS / SATISFACTION RATIOS ACCORDING TO TYPES OF STUDY.

Finally, we analysed the relationship between success and satisfaction when subjects were grouped according to the type of qualification that they led to (Table 13). This led to the following distribution of averages for success and performance ratios, and for satisfaction with resources and overall teaching (Resources and Satisfaction respectively).

Table13.- Frecuency by TYPE OF STUDIES

|  | $\boldsymbol{N}$ | $\boldsymbol{\%}$ | Perf. | Succes. | Resources | Satisfaction |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| SOCIAL AND LEGAL SCIENCES | 497 | 34,0 | 60,13 | 70,63 | 5,68 | 6,36 |
| EXPERIMENTAL SCIENCES | 184 | 12,6 | 61,82 | 68,53 | 6,32 | 6,30 |
| HEALTH SCIENCES | 75 | 5,1 | 82,31 | 85,39 | 4,77 | 6,28 |
| HUMANITIES | 156 | 10,7 | 59,82 | 74,00 | 5,78 | 6,16 |
| INGENIERING STUDIES | 550 | 37,6 | 55,55 | 67,39 | 5,81 | 5,99 |

These values indicate higher performance ratios and success in the field of Health Sciences, and a greater mismatch in the same ratios in the Humanities and Ingeniering degrees.

If subjects are divided by squares, according to success and satisfaction, (figure 3), this distribution shows that there is a more direct link between success/performance and satisfaction (squares 1 and 3), in Health Science courses and that Humanities degrees are most often located in squares two and four (low success and high satisfaction or high success and low satisfaction), thus highlighting the fact that, although differences are not significant ( p - value 0.944 ), other variables apart from academic success are nevertheless affecting satisfaction.

Figure 3.- Scatter graph of subjects by squares.

## 7. CONCLUSIONS.

The main conclusions that come to light out of this correlation study of academic success, expressed as the pass rate of students sitting the exam, and satisfaction with teaching, are the following:

1. The teaching evaluation questionnaire deals with two factors. One relates to general satisfaction, including all the facets related to the dynamics of teaching and learning, and the other relates to the physical environment where teaching is imparted. These issues coincide with those described by other researchers (Aldridge, S.\& Rowley, J., 1998) ${ }^{3}$. The high level of reliability of the questionnaire means that its results can be used as a measure of satisfaction levels with teaching and its link with academic success
2. The diverse typology and fields of study of the subjects makes any general relationship between academic success and satisfaction difficult to confirm. However, when subjects are grouped according to success levels, there are clear indications that satisfaction with teaching is greater in the higher pass rate groups (the success ratio).
3. The difference between enrolments in a subject and examinees is confirmed as a variable affecting the relationship between success and satisfaction; higher levels of dissatisfaction are observed in subjects in which large numbers of enrolled students fail to sit their exams, after not seeing their learning expectations fulfilled.
4. Finally, it is noteworthy that the variations noted in the success/satisfaction relationship according to types of study have a certain homogeneity about them with a predominance of a direct relationship between the both variables; however, in the Humanities degrees, there is somewhat greater dispersion, as the inverse relationship is more common. One of the outcomes is that there is a need for more in-depth analysis based on specific subjects and options, so as to flesh out the quality infrastructure of university teaching.
